

Group 3200_21

Minutes of Meeting 5

19/08/2026

Present: Christo, Dylan, Lithasa, Dhava, Murphy, Terry

Apologies:

Absentees:

Meeting Start: 12.55pm

Meeting End: 1:30pm

Time:	Item #	Topic:	Details:	Action:
12:55	1	Demo	Demonstrated gesture recognition prototype Demonstrated person identification	
13:00	2	Feedback	Next step is to link velocity with gesture Move: maximum velocity is ~0.3 - 0.5ms Turn: max velocity is ~0.3-0.5ms Have to limit speed for safety Lock velocity to one direction, one gesture locks any other movement (can't execute two commands at the same time) One gesture for one command Get mujoco up and running. Search unitree on github. Person identification: - Measure dimension of the joint - Ensure degree of freedom matches the robot: 3D for shoulder, 1D for elbow, 3D for wrist - Read all of the joints and map it to the mujoco robot simulation - If done correctly, robot simulation should perfectly mimic your actions from the webcam. - Limit joint velocity and joint angle of movement (check limitations and other info online for model: URDF model)	
13:25	5	Tasks for next 2 weeks	Get everything linked to mujoco by week 7 9 th of September Both teams linking their project to separate mujoco simulations, no need to combine yet.	
14:00	6	Meeting end
